DAIFEND

SECURING THE AI RUNTIME

1-PAGE INVESTOR HANDOUT

AI-NATIVE SECURITY CONTROL PLANE

Traditional security protects infrastructure. Daifend protects AI systems.

Daifend is an AI-native security infrastructure platform for **agents**, **vector memory**, and **RAG pipelines**. It detects manipulation/poisoning, enforces runtime policies, and autonomously restores trust.

MEMORY INTEGRITY

Trust

0–100

Embedding trust scoring, drift detection, lineage explorer, rollback.

AGENT RUNTIME

Contain

POLICY

Tool sandboxing, permissions, reasoning-chain auditability, rollback.

RAG SECURITY

Validate

RETRIEVAL

Prompt injection detection, malicious docs quarantine, chain validation.

WHY NOW

- AI systems are becoming autonomous and stateful (memory + tools).
- Attackers target meaning: poisoning, injection, manipulation, identity spoofing.
- Enterprises need runtime integrity + recovery, not dashboards.

WHAT DAIFEND DOES

- **Detect**: signatures + drift correlation across memory/RAG/agents.
- **Enforce**: policy gates on writes, retrieval, and tool execution.
- **Heal**: isolate blast radius, rollback to trusted baselines, restore trust.

INVESTOR DEMO: LIVE AI ATTACK SIMULATION

Upload malicious document → memory poisoned → agent retrieves → trust drops → detection → isolation → self-heal → report.

POISON INJECT DETECT RESTORE

OUTPUTS

- Trust timeline + drift heatmap
- Threat ticker (AI-native signatures)
- Self-healing actions feed
- Structured incident report
